

DIFFERENTIAL SUBORDINATION AND SUPERORDINATION  
FOR A NEW DIFFERENTIAL OPERATOR CONTAINING  
MITTAG-LEFFLER FUNCTION

SUHILA ELHADDAD<sup>1</sup> AND MASLINA DARUS<sup>1\*</sup>

ABSTRACT. Owing to the importance and great interest of linear operators, a generalisation of linear derivative operator  $\tilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  is newly introduced in this study. The main objective of this paper is to investigate various subordination and superordination related to the aforementioned generalised linear derivative operator. Additionally, the resultant sandwich-type of this operator is also considered.

1. DEFINITION AND PRELIMINARIES

Let  $\Delta = \{z \in \mathbb{C} : |z| < 1\}$  be the open unit disk and  $\mathcal{H} = \mathcal{H}(\Delta)$  indicate the family of analytic functions within  $\Delta$ . For  $a \in \mathbb{C}$  and  $n \in \mathbb{N}$ , let  $\mathcal{H}[a, n]$  be the subclass of  $\mathcal{H}$  containing the functions of the form

$$\mathcal{H}[a, n] = \left\{ f \in \mathcal{H}(\Delta) : f(z) = a + a_n z^n + a_{n+1} z^{n+1} + \dots \right\}, \quad z \in \Delta.$$

Furthermore, let  $\mathcal{A}(p)$  indicate the subclass of  $\mathcal{H}$  containing the functions having the following form

$$(1.1) \quad f(z) = z^p + \sum_{i=p+1}^{\infty} a_i z^i, \quad p \in \mathbb{N},$$

which are analytic and  $p$ -valent in  $\Delta$ . For clarity, we write  $\mathcal{A}(1) = \mathcal{A}$ .

---

*Key words and phrases.* Analytic functions, starlike functions, linear operator, superordination, subordination, Mittag-Leffler function.

*Accepted:* May 08, 2019.

The convolution (or Hadamard product)  $f * g$  for two analytic functions  $f$  defined by (1.1) and

$$g(z) = z^p + \sum_{i=p+1}^{\infty} b_i z^i$$

is given by

$$f(z) * g(z) = z^p + \sum_{i=p+1}^{\infty} a_i b_i z^i.$$

For the two analytic functions  $f$  and  $g$  in  $\mathcal{H}(\Delta)$ , we are saying that  $f(z)$  is subordinate to  $g(z)$  usually denoted by  $f(z) \prec g(z)$  in case if there is a Schwarz function  $\omega$  with  $\omega(z) = 0$ ,  $|\omega(z)| < 1$ ,  $z \in \Delta$ , such that  $f(z) = g(\omega(z))$  for all  $z \in \Delta$ .

Especially, if  $g(z)$  is univalent in  $\Delta$ , then  $f \prec g$  if and only if  $f(0) = g(0)$  and  $f(\Delta) \subseteq g(\Delta)$ .

Let  $\mathcal{S}_\alpha^*(p)$  and  $\mathcal{K}_\alpha(p)$  denote the familiar subclasses of the class  $\mathcal{A}(p)$  consisting of the functions which are  $p$ -valently starlike and  $p$ -valently convex of order  $\alpha$  in  $\Delta$ , respectively,

$$\mathcal{S}_\alpha^*(p) = \left\{ f \in \mathcal{A}(p) : \operatorname{Re} \left\{ \frac{z f'(z)}{f(z)} \right\} > \alpha, z \in \Delta \right\},$$

$$\mathcal{K}_\alpha(p) = \left\{ f \in \mathcal{A}(p) : \operatorname{Re} \left\{ 1 + \frac{z f''(z)}{f'(z)} \right\} > \alpha, z \in \Delta \right\}.$$

The method of differential subordinations, which is additionally called the admissible functions method, was maybe the first one presented by Miller and Mocanu in 1978 [13]. From that point onward and roughly in 1981 [14] the theory started to proliferate and progressively develop. Relevant details are epitomized in a book written by Miller and Mocanu [15].

**Definition 1.1** (see [15]). Let  $\varphi : \mathbb{C}^3 \times \Delta \rightarrow \mathbb{C}$  and  $h(z)$  be univalent in  $\Delta$ . If  $\zeta(z)$  is analytic function in  $\Delta$  and also satisfies the second-order differential subordination

$$(1.2) \quad \varphi(\zeta(z), z\zeta'(z), z^2\zeta''(z); z \in \Delta) \prec h(z), \quad z \in \Delta,$$

then  $\zeta(z)$  is defined as a solution of the differential subordination (1.2). A univalent function  $q(z)$  is called a dominant if  $\zeta(z) \prec q(z)$  for all  $\zeta(z)$  satisfying (1.2). A dominant  $\tilde{q}$  is called the best dominant when  $\tilde{q} \prec q$  for all dominants  $q$  of (1.2).

**Definition 1.2** (see [16]). Let  $\phi : \mathbb{C}^3 \times \Delta \rightarrow \mathbb{U}$  let  $h(z)$  be analytic function in  $\Delta$ . If  $\zeta(z)$  and  $\phi(\zeta(z), z\zeta'(z), z^2\zeta''(z); z)$  are univalent in  $\Delta$  and  $\zeta(z)$  satisfies the (second-order) differential subordination

$$(1.3) \quad h(z) \prec \phi(\zeta(z), z\zeta'(z), z^2\zeta''(z)), \quad z \in \Delta,$$

then  $\zeta(z)$  is defined as a solution of the differential subordination (1.3). An analytic function  $q(z)$  is called a subordinates, if  $q(z) \prec \zeta(z)$  for all  $\zeta(z)$  satisfying (1.3). A univalent subordinate  $\tilde{q}$  is called the best subordinate when  $q \prec \tilde{q}$  for all subordinates  $q$  of (1.3).

**Definition 1.3** (see [16]). Let  $G$  denote the set of functions  $f$  which are analytic and injective on  $\overline{\Delta} \setminus B(f)$ , where

$$B(f) = \left\{ \xi \in \partial\Delta : \lim_{z \rightarrow \xi} f(z) = \infty \right\},$$

and  $f'(\xi) \neq 0, \xi \in \partial\Delta \setminus B(f)$ .

In 1999, Dziok and Srivastava [6] introduced the function  $g_p(a_1, \dots, a_r, b_1, \dots, b_s; z)$ , which defined by generalized hypergeometric function as following

$$(1.4) \quad g_p(a_1, \dots, a_r, b_1, \dots, b_s; z) = z^p + \sum_{i=p+1}^{\infty} \frac{(a_1)_{i-p} \cdots (a_r)_{i-p}}{(b_1)_{i-p} \cdots (b_s)_{i-p}} \frac{z^i}{(i-p)!}, \quad p \in \mathbb{N},$$

where  $a_k \in \mathbb{C}, b_n \in \mathbb{C} \setminus \{0, -1, \dots\}, k = 1, \dots, r, n = 1, \dots, s$  and  $r \leq 1 + s, r, s \in \mathbb{N}_0$  and  $(v)_i$  is the Pochhammer symbol defined by

$$(v)_i = \frac{\Gamma(v+i)}{\Gamma(v)} = \begin{cases} v(v+1) \cdots (v+i-1), & i = 1, 2, \dots, \\ 1, & i = 0. \end{cases}$$

For convenience, we write  $g_p(a_1, \dots, a_r, b_1, \dots, b_s; z) = \mathfrak{G}_p(a_1, b_1; z)$ .

The well known Mittag-Leffler function  $E_\alpha(z)$  which is introduced by Mittag-Leffler [17] and [18] is defined hereunder. Similarly, the first two parametric generalization  $E_{\alpha,\beta}(z)$  of the same function by Wiman [27] is defined as well

$$E_\alpha(z) = \sum_{i=0}^{\infty} \frac{z^i}{\Gamma(\alpha i + 1)}$$

and

$$E_{\alpha,\beta}(z) = \sum_{i=0}^{\infty} \frac{z^i}{\Gamma(\alpha i + \beta)},$$

where  $\alpha, \beta \in \mathbb{C}, \operatorname{Re}(\alpha) > 0$  and  $\operatorname{Re}(\beta) > 0$ .

The above mentioned resulted in plenty of valuable work has been made by numerous authors in an endeavor to clarify Mittag-Leffler function and its first two parametric generalization, see for instance [4, 8–10, 20, 23, 25] and [26].

Now, we define the function  $\mathcal{F}_{\alpha,\beta}(z)$  by

$$\mathcal{F}_{\alpha,\beta}(z) = z\Gamma(\beta)E_{\alpha,\beta}(z) = z + \sum_{i=2}^{\infty} \frac{\Gamma(\beta)}{\Gamma(\alpha(i-1) + \beta)} z^i.$$

Having use of the function  $\mathcal{F}_{\alpha,\beta}(z)$ , Elhaddad et al. [7] defined the differential operator  $\mathcal{D}_\delta^m(\alpha, \beta)f : \mathcal{A} \rightarrow \mathcal{A}$  as illustrated below:

$$(1.5) \quad \mathcal{D}_\delta^m(\alpha, \beta)f(z) = z + \sum_{i=2}^{\infty} [1 + (i-1)\delta]^m \frac{\Gamma(\beta)}{\Gamma(\alpha(i-1) + \beta)} a_i z^i,$$

where  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}, \delta > 0$ .

Now, we define the operator  $\mathcal{D}_\delta^m(\alpha, \beta)f(z)$  in (1.5) of a function  $f \in \mathcal{A}(p)$  given by (1.1) as below:

$$(1.6) \quad \mathcal{D}_{\delta,p}^m(\alpha, \beta)f(z) = z^p + \sum_{i=p+1}^{\infty} \left[ \frac{p + (i - p)\delta}{p} \right]^m \frac{\Gamma(\beta)}{\Gamma(\alpha(i - p) + \beta)} a_i z^i, \quad p \in \mathbb{N},$$

where  $m \in \mathbb{N}_0, \delta > 0$ .

Corresponding to  $\mathcal{G}_p(a_1, b_1; z)$  which defined in (1.4),  $\mathcal{D}_{\delta,p}^m(\alpha, \beta)f(z)$  defined in (1.6) and utilizing Hadamard product, we define a new generalized derivative operator  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  as follows.

**Definition 1.4.** Let  $f \in \mathcal{A}(p)$ , then the generalized derivative operator  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z) : \mathcal{A}(p) \rightarrow \mathcal{A}(p)$  is given by

$$(1.7) \quad \begin{aligned} &\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z) \\ &= \mathcal{G}_p(a_1, b_1; z) * \mathcal{D}_{\delta,p}^m(\alpha, \beta)f(z) \\ &= z^p + \sum_{i=p+1}^{\infty} \left[ \frac{p + (i - p)\delta}{p} \right]^m \frac{\Gamma(\beta)}{\Gamma(\alpha(i - p) + \beta)} \frac{(a_1)_{i-p} \cdots (a_r)_{i-p}}{(b_1)_{i-p} \cdots (b_s)_{i-p}} \frac{a_i z^i}{(i - p)!}. \end{aligned}$$

We can easily verify from (1.7) that

$$(1.8) \quad \begin{aligned} p\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z) &= (p - p\delta)\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z) \\ &\quad + \delta z(\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z))'. \end{aligned}$$

*Remark 1.1.* • For  $s = 0, r = 1, a_1 = 1, \alpha = 0, \beta = 1$  and  $p = 1$ , we get Al-Oboudi operator [1].

- For  $s = 0, r = 1, a_1 = 1, \beta = 1, \alpha = 0, \delta = 1$  and  $p = 1$ , we get Sălăgean operator [22].
- For  $s = 0, r = 1, a_1 = 1, m = 0$  and  $p = 1$ , we get  $\mathbb{E}_{\alpha,\beta}(z)$  [25].
- For  $m = 0, \alpha = 0$  and  $\beta = 1$ , we get the operator studied by Dziok and Srivastava [6].
- For  $m = 0, \alpha = 0, p = 1, r = 1, s = 0, a_1 = \lambda + 1$  and  $\beta = 1$ , we get the operator examined by Ruscheweyh [21].
- For  $m = 0, \alpha = 0, p = 1, r = 2, s = 1$  and  $\beta = 1$ , we get the operator which was introduced by Hohlov [11].
- For  $m = 0, \alpha = 0, p = 1, r = 2, s = 1, a_2 = 1$  and  $\beta = 1$ , we get the operator investigated by Carlson and Shaffer [5].

So as to demonstrate and approve above results, following primer results are required.

**Lemma 1.1** (see [24]). *Let  $g(z)$  be convex function within the open unit disk  $\Delta$  and let  $\nu$  and  $\mu$  be complex numbers,  $\nu \in \mathbb{C}$  and  $\mu \in \mathbb{C}/\{0\}$ , with*

$$\operatorname{Re} \left\{ \frac{zg''(z)}{g'(z)} + 1 \right\} > \max \left\{ -\operatorname{Re} \left( \frac{\nu}{\mu} \right), 0 \right\}.$$

If  $h(z)$  is analytic within  $\Delta$  and

$$(1.9) \quad \nu h(z) + \mu zh'(z) \prec \nu g(z) + \mu zg'(z).$$

Thus,  $h(z) \prec g(z)$ ,  $z \in \Delta$ , and  $g(z)$  is the best dominant of (1.9).

**Lemma 1.2** (see [16]). Let  $\mu$  be a complex number with  $\text{Re}(\mu) > 0$  and  $g$  be a convex function within  $\Delta$ . If  $h(z) \in \mathcal{H}[g(0), 1] \cap G$  and  $h(z) + \mu zh'(z)$  is univalent in  $\Delta$ , thus

$$(1.10) \quad g(z) + \mu zg'(z) \prec h(z) + \mu zh'(z),$$

consequently,  $g(z) \prec h(z)$  and  $g(z)$  is the best subdominant of (1.10).

## 2. MAIN RESULTS

**Theorem 2.1.** Let  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$ ,  $\delta > 0$ ,  $\sigma \in \mathbb{C}/\{0\}$  and  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  defined by (1.7). Let  $g(z)$  be univalent in  $\Delta$ , with  $g(0) = 1$ , and assume that

$$(2.1) \quad \text{Re} \left\{ \frac{zg''(z)}{g'(z)} + 1 \right\} > \max \left\{ -\frac{p}{\delta} \text{Re} \left( \frac{1}{\sigma} \right), 0 \right\}.$$

If  $f$  in the class  $\mathcal{A}(p)$  satisfies the subordination condition

$$(2.2) \quad \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) \prec g(z) + \frac{\sigma\delta}{p}zg'(z),$$

then

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \prec g(z)$$

and  $g(z)$  is the best dominant of (2.2).

*Proof.* Define the function  $\zeta(z)$  by

$$(2.3) \quad \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} = \zeta(z).$$

Differentiating (2.3) logarithmically with respect to  $z$ , we have

$$(2.4) \quad \frac{z\zeta'(z)}{\zeta(z)} = \frac{z(\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z))'}{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)} - p.$$

Using (1.8) in the resulting equation (2.4), we get

$$\begin{aligned} \frac{z\zeta'(z)}{\zeta(z)} &= \left(\frac{p}{\delta}\right) \left\{ \frac{z(\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z))'}{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)} - 1 \right\} \\ &= \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) \\ &= \zeta(z) + \frac{\sigma\delta}{p}z\zeta'(z), \end{aligned}$$

then the differential subordination from hypothesis (2.2) is equivalent to

$$\zeta(z) + \frac{\sigma\delta}{p}z\zeta'(z) \prec g(z) + \frac{\sigma\delta}{p}zg'(z).$$

To prove our result, we need to use Lemma 1.1. For that purpose, let  $\nu = 1$ ,  $\mu = \frac{\sigma\delta}{p}$ . We get

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \prec g(z),$$

which is the required result.  $\square$

Setting  $g(z) = \frac{1+Cz}{1+Dz}$  in Theorem 2.1, where  $-1 \leq D < C \leq 1$ . Then, the condition (2.1) turn into

$$(2.5) \quad \operatorname{Re} \left\{ \frac{1-Dz}{1+Dz} \right\} > \max \left\{ 0, -\frac{p}{\delta} \operatorname{Re} \left( \frac{1}{\sigma} \right) \right\}, \quad z \in \Delta.$$

The function

$$\Psi(\gamma) = \frac{1-\gamma}{1+\gamma}, \quad |\gamma| < |D|,$$

is convex in  $\Delta$  and since  $\Psi(\bar{\gamma}) = \overline{\Psi(\gamma)}$  for all  $|\gamma| < |D|$ , then the image  $\Psi(\Delta)$  is a convex domain symmetric with respect to the real axis. Thus,

$$\inf \left\{ \operatorname{Re} \left( \frac{1-Dz}{1+Dz} \right), z \in \Delta \right\} = \frac{1-|D|}{1+|D|} > 0.$$

Then, the relation (2.5) is identical to

$$\frac{p}{\delta} \operatorname{Re} \left( \frac{1}{\sigma} \right) \geq \frac{|D|-1}{|D|+1},$$

as a result, we get the following corollary.

**Corollary 2.1.** *Let  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$ ,  $\delta > 0$ ,  $-1 \leq D < C \leq 1$  and  $\sigma \in \mathbb{C} \setminus \{0\}$  with*

$$\max \left\{ 0, -\frac{p}{\delta} \operatorname{Re} \left( \frac{1}{\sigma} \right) \right\} \leq \frac{1-|D|}{1+|D|}.$$

*If  $f$  in the class  $\mathcal{A}(p)$  and*

$$(2.6) \quad \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1-\sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) \\ \prec \frac{1+Cz}{1+Dz} + \frac{\sigma\delta(C-D)z}{p(1+D)^2},$$

*then*

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \prec \frac{1+Cz}{1+Dz}$$

*and  $\frac{1+Cz}{1+Dz}$  is the best dominant of (2.6).*

**Theorem 2.2.** *Let  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$ ,  $\delta > 0$ ,  $\sigma \in \mathbb{C}/\{0\}$  and  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  defined by (1.7). Let  $h(z)$  be a convex function in  $\Delta$ , with  $h(0) = 1$ . Let  $f$  in the class  $\mathcal{A}(p)$  and*

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \in \mathcal{H}[1, 1] \cap G.$$

If

$$\sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right)$$

in univalent in  $\Delta$ , and

$$(2.7) \quad h(z) + \frac{\sigma\delta}{p}zh'(z) \prec \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right),$$

then

$$h(z) \prec \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p}$$

and  $h(z)$  is the best subordinant of (2.7).

*Proof.* Define the function  $\chi(z)$  by

$$(2.8) \quad \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} = \chi(z).$$

From the presumption of Theorem 2.2, we note that the function  $\chi$  is analytic in the open unit disk  $\Delta$ . Differentiating (2.8) logarithmically with respect to  $z$ , we get

$$(2.9) \quad \frac{z\chi'(z)}{\chi(z)} = \frac{z(\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z))'}{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)} - p.$$

Using (1.8) in (2.9) and after some calculations, we get

$$\chi(z) + \frac{\sigma\delta}{p}z\chi'(z) = \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right)$$

and presently, by utilizing Lemma 1.2, we have the specified result. □

Setting  $h(z) = \frac{1+Cz}{1+Dz}$  in Theorem 2.2, where  $-1 \leq D < C \leq 1$ , we get the following result.

**Corollary 2.2.** *Let  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$ ,  $\delta > 0$ ,  $\sigma \in \mathbb{C}/\{0\}$ ,  $-1 \leq D < C \leq 1$  and  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  defined by (1.7). Let  $f$  in the class  $\mathcal{A}(p)$  and*

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \in \mathcal{H}[1, 1] \cap G.$$

If

$$\sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right)$$

is univalent in  $\Delta$ , and

$$(2.10) \quad \frac{1 + Cz}{1 + Dz} + \frac{\sigma\delta(C - D)z}{p(1 + Dz)^2} \prec \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right),$$

then

$$\frac{1 + Cz}{1 + Dz} \prec \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p}$$

and  $\frac{1+Cz}{1+Dz}$  is the best subordinator of (2.10).

Combining Theorem 2.1 and Theorem 2.2, we get the following sandwich result.

**Theorem 2.3.** Let  $m \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$ ,  $\delta > 0$ ,  $\sigma \in \mathbb{C}/\{0\}$  and  $\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)$  defined by (1.7). Let  $h(z)$  and  $g(z)$  be a convex function in  $\Delta$ , with  $h(0) = g(0) = 1$ . Let  $f$  in the class  $\mathcal{A}(p)$  and

$$\frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \in \mathcal{H}[1, 1] \cap G.$$

If

$$\sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right)$$

is univalent in  $\Delta$  and

$$(2.11) \quad h(z) + \frac{\sigma\delta}{p}zh'(z) \prec \sigma \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^{m+1}(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) + (1 - \sigma) \left( \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \right) \prec g(z) + \frac{\sigma\delta}{p}zg'(z),$$

then

$$h(z) \prec \frac{\widetilde{\mathcal{H}}_{\delta,p}^m(\alpha, \beta, a_1, b_1)f(z)}{z^p} \prec g(z),$$

and  $h(z)$  and  $g(z)$  is the best subordinator and the best dominant respectively of (2.11).

We skip the proofing because it is the same as in the proof of the last theorem.

*Remark 2.1.* Other work associated with the derivative and integral operator for different issues can be determined in [2, 3, 12] and [19].
