

## ON ALMOST PSEUDO $m$ -PROJECTIVELY SYMMETRIC MANIFOLDS

Chawngthu Lalmalsawma<sup>1</sup> and Jay Prakash Singh<sup>2,3</sup>

**Abstract.** The object of the present paper is to study almost pseudo  $m$ -projectively symmetric manifolds. Some geometric properties of almost pseudo  $m$ -projectively symmetric manifolds have been studied under certain curvature conditions. Finally the existence of almost pseudo  $m$ -projectively symmetric manifolds is shown by examples.

*AMS Mathematics Subject Classification* (2010): 53C25

*Key words and phrases:* almost pseudo symmetric manifolds; almost pseudo  $m$ -projectively symmetric manifolds; Einstein manifold; Ricci symmetric manifold

### 1. Introduction

In 1926, Cartan [4] studied certain class of Riemannian spaces and he introduced the notion of a symmetric space. According to Cartan, an  $n$ -dimensional Riemannian manifold  $M$  is said to be locally symmetric if it has constant curvature, i.e if the curvature tensor satisfies  $R_{hijk,l} = 0$ , where  $'$  denotes the covariant differentiation with respect to the metric tensor and  $R_{hijk}$  are the components of the curvature tensor. Later, symmetric manifolds have been studied by many authors such as: recurrent manifolds introduced by Walker [23], conformally symmetric manifolds by Chaki and Gupta [6], conformally recurrent manifolds by Adati and Miyazawa [1], pseudo symmetric manifolds introduced by Chaki [5], almost pseudo symmetric and almost pseudo conformally symmetric manifolds by De and Gazi [11, 12] etc.

The notion of weakly symmetric manifolds was introduced by Tamassy and Binh [22] in 1989. A non-flat Riemannian manifold  $(M^n, g)$ ,  $(n > 2)$  is called weakly symmetric if the curvature tensor  $\tilde{R}$  of type (1,3) satisfies the condition:

$$\begin{aligned} \nabla_X \tilde{R}(Y, Z)W &= A(X)\tilde{R}(Y, Z)W + B(Y)\tilde{R}(X, Z)W + D(Z)\tilde{R}(Y, X)W \\ &\quad + E(W)\tilde{R}(Y, Z)X + g(\tilde{R}(Y, Z)W, X)P, \end{aligned}$$

where  $\nabla$  denotes the Levi-Civita connection on  $(M^n, g)$  and  $A, B, D, E$  and  $P$  are 1-forms and a vector field respectively which are non-zero simultaneously.

<sup>3</sup>Corresponding author

Such a manifold is denoted by  $(WS)_n$ . Weakly symmetric manifolds have been studied by several authors ([3], [10], [2], [17], [18] and many others).

In 1987, Chaki [5] studied a type of non-flat Riemannian manifold whose curvature tensor satisfies

$$(1.1) \quad R_{hijk,l} = 2\lambda_l R_{hijk} + \lambda_h R_{lij k} + \lambda_i R_{hljk} + \lambda_j R_{hil k} + \lambda_k R_{hij l},$$

where  $\lambda_l$  is a non-zero covariant vector. A manifold whose curvature tensor satisfies the above equation is called a pseudo symmetric manifold [5]. It is to be noted that (1.1) was already obtained by Sen and Chaki [20] when they studied certain kind of a conformally flat Riemannian space. A pseudo symmetric manifold is denoted by  $(PS)_n$ .

In index-free notation equation (1.1) is given by

$$(1.2) \quad \begin{aligned} (\nabla_X \tilde{R})(Y, Z)W &= 2A(X)\tilde{R}(Y, Z)W + A(Y)\tilde{R}(X, Z)W + A(Z)\tilde{R}(Y, X)W \\ &+ A(W)\tilde{R}(Y, Z)X + g(\tilde{R}(Y, Z)W, X)P, \end{aligned}$$

where  $\tilde{R}$  is a Riemannian curvature tensor of type (1,3),  $\nabla$  denotes the Levi-Civita connection,  $A$  is a non-zero 1-form and  $P$  is a vector field defined by

$$g(X, P) = A(X),$$

for all  $X$ .

In 2008 De and Gazi [11] introduced a type of Riemannian manifold which is a generalization of pseudo symmetric manifolds. Such manifold is called an almost pseudo symmetric manifold and is denoted by  $(APS)_n$ . A Riemannian manifold  $(M^n, g)$ ,  $(n > 2)$  is said to be almost pseudo symmetric [11] if its curvature tensor  $R$  of type (0, 4) satisfies the condition:

$$(1.3) \quad \begin{aligned} (\nabla_X R)(Y, Z, U, V) &= [A(X) + B(X)]R(Y, Z, U, V) \\ &+ A(Y)R(X, Z, U, V) + A(Z)R(Y, X, U, V) \\ &+ A(U)R(Y, Z, X, V) + A(V)R(Y, Z, U, X), \end{aligned}$$

where  $A, B$  are non-zero 1-forms defined by

$$g(X, P) = A(X), g(X, Q) = B(X),$$

for all vector fields  $X$ . In the papers ([12], [13]) it was mentioned that  $(PS)_n$  is a particular case of an  $(APS)_n$ , but  $(WS)_n$  is not a particular case of an  $(APS)_n$ .

In 1971, Pokhariyal and Mishra [16] introduced a new curvature tensor of type (1,3) in an  $n$ -dimensional Riemannian manifold  $(M^n, g)$ ,  $n > 2$  denoted by  $\tilde{M}$  and defined by

$$(1.4) \quad \begin{aligned} \tilde{M}(Y, Z)U &= \tilde{R}(Y, Z)U - \frac{1}{2(n-1)}[S(Z, U)Y - S(Y, U)Z \\ &+ g(Z, U)L Y - g(Y, U)L Z], \end{aligned}$$

where  $\tilde{R}$  and  $L$  denote the Riemannian curvature tensor of type (1,3) and the Ricci operator defined by  $g(LX, Y) = S(X, Y)$ , respectively. Such a tensor  $\tilde{M}$  is known as an  $m$ -projective curvature tensor. The  $m$ -projective curvature tensor have been studied by J.P. Singh [21], S.K. Chaubey and R.H. Ojha [8], S.K. Chaubey [7], and many others.

From (1.4) we can define a (0,4) type  $m$ -projective curvature tensor  $M$  as follows:

$$(1.5) \quad M(Y, Z, U, V) = R(Y, Z, U, V) - \frac{1}{2(n-1)}[S(Z, U)g(Y, V) - S(Y, U)g(Z, V) + S(Y, V)g(Z, U) - S(Z, V)g(Y, U)],$$

where  $R$  denotes the Riemannian curvature tensor of type (0,4) defined by

$$R(Y, Z, U, V) = g(\tilde{R}(Y, Z)U, V),$$

and

$$M(Y, Z, U, V) = g(\tilde{M}(Y, Z)U, V),$$

where  $\tilde{R}$  is the Riemannian curvature tensor of type (1,3) and  $S$  denotes the Ricci tensor of type (0,2) respectively.

The  $m$ -projective curvature tensor satisfies the properties of the Riemannian curvature tensor. The object of the present paper is to study a type of non-flat Riemannian manifold  $(M^n, g)$ , ( $n > 2$ ) whose  $m$ -projective curvature tensor  $M$  of type (0,4) satisfies the condition:

$$(1.6) \quad \begin{aligned} (\nabla_X M)(Y, Z, U, V) &= [A(X) + B(X)]M(Y, Z, U, V) \\ &+ A(Y)M(X, Z, U, V) + A(Z)M(Y, X, U, V) \\ &+ A(U)M(Y, Z, X, V) + A(V)M(Y, Z, U, X). \end{aligned}$$

Such a manifold shall be called an almost pseudo  $m$ -projectively symmetric manifold and an  $n$ -dimensional manifold of this kind shall be denoted by  $(APMPS)_n$ . In a recent paper De and Mallick [9] studied almost pseudo circularly symmetric manifolds and Prajjwal Pal [15] studied almost pseudo conharmonically symmetric manifolds. Motivated by the above studies, in the present paper we have studied a type of non-flat Riemannian manifold.

This paper is organized as follows: After preliminaries in Section 2, we obtain a necessary and sufficient condition for constant scalar curvature of a  $(APMPS)_n$ , ( $n > 2$ ). In Section 4 we study  $(APMPS)_n$ , ( $n > 2$ ) satisfying Codazzi type of Ricci tensor. The next section is devoted to the study of Einstein  $(APMPS)_n$ . In Section 6, we study Ricci symmetric  $(APMPS)_n$ , ( $n > 2$ ) and we proved that the scalar curvature of a Ricci symmetric  $(APMPS)_n$  is constant. Finally, non-trivial examples of  $(APMPS)_n$  have been constructed.

## 2. Preliminaries

Let  $S$  and  $r$  denote the Ricci tensor of type (0,2) and the scalar curavture respectively and  $L$  denotes the symmetric tensor of type (1,1) corresponding to the Ricci tensor  $S$ , that is,

$$g(LX, Y) = S(X, Y).$$

In this section, some formulas useful while studying  $(APMPS)_n$  are derived. Let  $\{e_i\}$  be an orthonormal basis of the tangent space at each point of the manifold, where  $1 \leq i \leq n$ . From (1.4) we can easily verify that the tensor  $M$  satisfies the following property

$$(2.1) \quad \begin{aligned} & \tilde{M}(Y, Z)U = -\tilde{M}(Z, Y)U, \\ & \tilde{M}(Y, Z)U + \tilde{M}(Z, U)Y + \tilde{M}(U, Y)Z = 0. \end{aligned}$$

From (1.5) and (2.1) it follows that

$$(2.2) \quad \begin{aligned} (i) \quad & M(Y, Z, U, V) = -M(Z, Y, U, V), \\ (ii) \quad & M(Y, Z, U, V) = -M(Y, Z, V, U), \\ (iii) \quad & M(Y, Z, U, V) = M(U, V, Y, Z), \\ (iv) \quad & M(Y, Z, U, V) + M(Z, U, Y, V) + M(U, Y, Z, V) = 0. \end{aligned}$$

Also from the equation (1.5) we have

$$(2.3) \quad \sum_{i=1}^n M(Y, Z, e_i, e_i) = 0 = \sum_{i=1}^n M(e_i, e_i, U, V)$$

and

$$(2.4) \quad \begin{aligned} \sum_{i=1}^n M(e_i, Z, U, e_i) &= \sum_{i=1}^n M(Z, e_i, e_i, U) \\ &= \frac{n}{2(n-1)} [S(Z, U) - \frac{r}{n}g(Z, U)], \end{aligned}$$

where  $r = \sum_{i=1}^n \epsilon_i S(e_i, e_i)$  is the scalar curvature.

### 3. $(APMPS)_n$ , $(n > 2)$ with constant scalar curvature

From (1.5) we have,

$$(3.1) \quad \begin{aligned} & (\nabla_X M)(Y, Z, U, V) = (\nabla_X R)(Y, Z, U, V) \\ & - \frac{1}{2(n-1)} [(\nabla_X S)(Z, U)g(Y, V) - (\nabla_X S)(Y, U)g(Z, V) \\ & + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U)]. \end{aligned}$$

From (1.6) and (3.1) we obtain

$$\begin{aligned}
 (\nabla_X R)(Y, Z, U, V) &= [A(X) + B(X)]M(Y, Z, U, V) \\
 &+ A(Y)M(X, Z, U, V) + A(Z)M(Y, X, U, V) + A(U)M(Y, Z, X, V) \\
 &+ A(V)M(Y, Z, U, X) + \frac{1}{2(n-1)}[(\nabla_X S)(Z, U)g(Y, V) \\
 (3.2) \quad &+ (\nabla_X S)(Y, U)g(Z, V) + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U)].
 \end{aligned}$$

Contracting (3.2) over  $Y$  and  $V$  we get

$$\begin{aligned}
 (\nabla_X S)(Z, U) &= \frac{n}{2(n-1)}[A(X) + B(X)][S(Z, U) - \frac{r}{n}g(Z, U)] \\
 &+ A(\tilde{M}(X, Z)U) + \frac{n}{2(n-1)}A(Z)[S(X, U) - \frac{r}{n}g(X, U)] \\
 &+ \frac{n}{2(n-1)}A(U)[S(Z, X) - \frac{r}{n}g(Z, X)] + A(\tilde{M}(X, U)Z) \\
 (3.3) \quad &+ \frac{1}{2(n-1)}[(n-2)(\nabla_X S)(Z, U) + dr(X)g(Z, U)].
 \end{aligned}$$

Again contracting (3.3) over  $Z$  and  $U$  we get

$$\frac{2n}{(n-1)}[A(LX) - \frac{r}{n}A(X)] = 0.$$

Since  $n > 2$ , the above expression implies that

$$(3.4) \quad A(LX) - \frac{r}{n}A(X) = 0.$$

We have Bianchi's second identity for (0,4) Riemannian curvature tensor  $R$  as follows:

$$(3.5) \quad (\nabla_X R)(Y, Z, U, V) + (\nabla_Y R)(Z, X, U, V) + (\nabla_Z R)(X, Y, U, V) = 0.$$

Using (3.2) and (3.5) we get

$$\begin{aligned}
& [-A(X) + B(X)]M(Y, Z, U, V) + [-A(Y) + B(Y)]M(Z, X, U, V) \\
& \quad + [-A(Z) + B(Z)]M(X, Y, U, V) \\
& + A(U)[M(Y, Z, X, V) + M(Z, X, Y, V) + M(X, Y, Z, V)] \\
& + A(V)[M(Y, Z, U, X) + M(Z, X, U, Y) + M(X, Y, U, Z)] \\
& + \frac{1}{2(n-1)} [(\nabla_X S)(Z, U)g(Y, V) - (\nabla_X S)(Y, U)g(Z, V) \\
& \quad + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U) \\
& \quad + (\nabla_Y S)(X, U)g(Z, V) - (\nabla_Y S)(Z, U)g(X, V) \\
& \quad + (\nabla_Y S)(Z, V)g(X, U) - (\nabla_Y S)(X, V)g(Z, U) \\
& \quad + (\nabla_Z S)(Y, U)g(X, V) - (\nabla_Z S)(X, U)g(Y, V) \\
(3.6) \quad & + (\nabla_Z S)(X, V)g(Y, U) - (\nabla_Z S)(Y, V)g(X, U)] = 0.
\end{aligned}$$

Making use of (2.2) in the equation (3.6) we get

$$\begin{aligned}
& [-A(X) + B(X)]M(Y, Z, U, V) + [-A(Y) + B(Y)]M(Z, X, U, V) \\
& \quad + [-A(Z) + B(Z)]M(X, Y, U, V) \\
& + \frac{1}{2(n-1)} [(\nabla_X S)(Z, U)g(Y, V) - (\nabla_X S)(Y, U)g(Z, V) \\
& \quad + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U) \\
& \quad + (\nabla_Y S)(X, U)g(Z, V) - (\nabla_Y S)(Z, U)g(X, V) \\
& \quad + (\nabla_Y S)(Z, V)g(X, U) - (\nabla_Y S)(X, V)g(Z, U) \\
& \quad + (\nabla_Z S)(Y, U)g(X, V) - (\nabla_Z S)(X, U)g(Y, V) \\
(3.7) \quad & + (\nabla_Z S)(X, V)g(Y, U) - (\nabla_Z S)(Y, V)g(X, U)] = 0.
\end{aligned}$$

Contracting (3.7) over  $Y$  and  $V$  we get

$$\begin{aligned}
& n[-A(X) + B(X)][S(Z, U) - \frac{r}{n}g(Z, U)] \\
& + 2(n-1)[-A(\tilde{M}(Z, X)U) + B(\tilde{M}(Z, X)U)] \\
& - n[-A(Z) + B(Z)][S(X, U) - \frac{r}{n}g(X, U)] \\
& + (n-3)\{(\nabla_X S)(Z, U) - (\nabla_Z S)(X, U)\} \\
(3.8) \quad & + \frac{1}{2}\{dr(X)g(Z, U) - dr(Z)g(X, U)\} = 0.
\end{aligned}$$

Again contracting (3.8) over  $Z$  and  $U$  we get

$$(3.9) \quad [A(LX) - \frac{r}{n}A(X)] - 2n[B(LX) - \frac{r}{n}B(X)] + (n-2)dr(X) = 0.$$

Combining the equations (3.4) and (3.9), we obtain

$$(3.10) \quad B(LX) - \frac{r}{n}B(X) = \frac{(n-2)}{2n}dr(X).$$

Thus we can state the following:

**Theorem 3.1.** *The scalar curvature  $r$  of an almost pseudo  $m$ -projectively symmetric manifold is constant if and only if*

$$(3.11) \quad B(LX) - \frac{r}{n}B(X) = 0$$

*holds for all vector fields.*

#### 4. $(APMPS)_n$ , $(n > 2)$ with Codazzi type of Ricci tensor

In 1978, Gray [14] introduced two classes of Riemannian manifolds. The class A consisting of all Riemannian manifolds whose Ricci tensor  $S$  satisfies,

$$(\nabla_X S)(Y, Z) + (\nabla_Y S)(Z, X) + (\nabla_Z S)(X, Y) = 0,$$

and the class B consisting of all Riemannian manifolds whose Ricci tensor is a Codazzi tensor, that is,

$$(\nabla_X S)(Y, Z) - (\nabla_Y S)(X, Z) = 0.$$

Suppose that the Ricci tensor of the  $(APMPS)_n$  is a Codazzi type tensor, that is,

$$(4.1) \quad (\nabla_X S)(Y, Z) = (\nabla_Y S)(X, Z).$$

Now from (3.1) we get

$$(4.2) \quad \begin{aligned} & (\nabla_X M)(Y, Z, U, V) = (\nabla_X R)(Y, Z, U, V) \\ & - \frac{1}{2(n-1)} [(\nabla_X S)(Z, U)g(Y, V) - (\nabla_X S)(Y, U)g(Z, V) \\ & + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U)]. \end{aligned}$$

By (4.2) we obtain

$$(4.3) \quad \begin{aligned} & (\nabla_X M)(Y, Z, U, V) + (\nabla_Y M)(Z, X, U, V) + (\nabla_Z M)(X, Y, U, V) \\ & = [(\nabla_X R)(Y, Z, U, V) + (\nabla_Y R)(Z, X, U, V) + (\nabla_Z R)(X, Y, U, V)] \\ & - \frac{1}{2(n-1)} [(\nabla_X S)(Z, U)g(Y, V) - (\nabla_X S)(Y, U)g(Z, V) \\ & + (\nabla_X S)(Y, V)g(Z, U) - (\nabla_X S)(Z, V)g(Y, U) \\ & + (\nabla_Y S)(X, U)g(Z, V) - (\nabla_Y S)(Z, U)g(X, V) \\ & + (\nabla_Y S)(Z, V)g(X, U) - (\nabla_Y S)(X, V)g(Z, U) \\ & + (\nabla_Z S)(Y, U)g(X, V) - (\nabla_Z S)(X, U)g(Y, V) \\ & + (\nabla_Z S)(X, V)g(Y, U) - (\nabla_Z S)(Y, V)g(X, U)]. \end{aligned}$$

Using (4.1) and (3.5) in (4.3) we get

$$(4\nabla_X M)(Y, Z, U, V) + (\nabla_Y M)(Z, X, U, V) + (\nabla_Z M)(X, Y, U, V) = 0.$$

Hence we have the following theorem.

**Theorem 4.1.** *In an (APMPS) $_n$ , ( $n > 2$ ) satisfying Codazzi type of Ricci tensor, the  $m$ -projective curvature tensor satisfies Bianchi's second identity.*

## 5. Einstein (APMPS) $_n$ , ( $n > 2$ )

If a (APMPS) $_n$ , ( $n > 2$ ) is an Einstein manifold, then the Ricci tensor satisfies

$$(5.1) \quad S(Y, Z) = \frac{r}{n}g(Y, Z).$$

Therefore,

$$(5.2) \quad (\nabla_X S)(Y, Z) = 0,$$

and

$$(5.3) \quad dr(X) = 0.$$

Using (5.1) and (5.2) we get from (1.5)

$$(5.4) \quad (\nabla_X M)(Y, Z, U, V) = (\nabla_X R)(Y, Z, U, V),$$

which yields

$$(5.5) \quad \begin{aligned} & [A(X) + B(X)]M(Y, Z, U, V) + A(Y)M(X, Z, U, V) \\ & \quad + A(Z)M(Y, X, U, V) + A(U)M(Y, Z, X, V) \\ & + A(V)M(Y, Z, U, X) = [A(X) + B(X)]R(Y, Z, U, V) \\ & \quad + A(Y)R(X, Z, U, V) + A(Z)R(Y, X, U, V) \\ & \quad + A(U)R(Y, Z, X, V) + A(V)R(Y, Z, U, X). \end{aligned}$$

In light of the equation (5.1), the equation (1.5) assumes the following form

$$(5.6) \quad \begin{aligned} M(Y, Z, U, V) = R(Y, Z, U, V) - \frac{r}{n(n-1)} & [g(Z, U)g(Y, V) \\ & - g(Y, U)g(Z, V)]. \end{aligned}$$

Now using (5.6) in (5.5) we get

$$\begin{aligned} \frac{r}{n(n-1)} & [\{A(X) + B(X)\}\{g(Z, U)g(Y, V) - g(Y, U)g(Z, V)\} \\ & \quad + A(Y)\{g(Z, U)g(X, V) - g(X, U)g(Z, V)\} \\ & \quad + A(Z)\{g(X, U)g(Y, V) - g(Y, U)g(X, V)\} \\ & \quad + A(U)\{g(Z, X)g(Y, V) - g(Y, X)g(Z, V)\} \\ & \quad + A(V)\{g(Z, U)g(Y, X) - g(Y, U)g(Z, X)\}] = 0, \end{aligned}$$

which implies

$$(5.7) \quad \begin{aligned} & r[\{A(X) + B(X)\}\{g(Z, U)g(Y, V) - g(Y, U)g(Z, V)\} \\ & \quad + A(Y)\{g(Z, U)g(X, V) - g(X, U)g(Z, V)\} \\ & \quad + A(Z)\{g(X, U)g(Y, V) - g(Y, U)g(X, V)\} \\ & \quad + A(U)\{g(Z, X)g(Y, V) - g(Y, X)g(Z, V)\} \\ & \quad + A(V)\{g(Z, U)g(Y, X) - g(Y, U)g(Z, X)\}] = 0. \end{aligned}$$

Now contracting (5.7) over  $Y$  and  $V$  we get

$$\begin{aligned} & r[(n-1)[A(X) + B(X)]g(Z, U) + A(X)g(Z, U) \\ & - A(Z)g(X, U) + (n-1)[A(Z)g(X, U) + A(U)g(Z, X)] \\ & \quad + A(X)g(Z, U) - A(U)g(Z, X)] = 0, \end{aligned}$$

which implies

$$(5.8) \quad \begin{aligned} & r[\{(n+1)A(X) + (n-1)B(X)\}g(Z, U) \\ & + (n-2)\{A(Z)g(X, U) + A(U)g(Z, X)\}] = 0. \end{aligned}$$

Again contracting (5.8) over  $Z$  and  $U$  we get

$$r[n(n+1)A(X) + n(n-1)B(X) + 2(n-2)A(X)] = 0,$$

which, in turn implies

$$r(n-1)[(n+4)A(X) + nB(X)] = 0,$$

which implies

$$(5.9) \quad r[(n+4)A(X) + nB(X)] = 0.$$

Again contracting (5.8) over  $Z$  and  $X$ , we get

$$r[(n+1)A(U) + (n-1)B(U) + (n-2)A(U) + n(n-2)A(U)] = 0,$$

which implies

$$(5.10) \quad r[(n+1)A(U) + B(U)] = 0.$$

Replacing  $U$  by  $X$  we get

$$(5.11) \quad r[(n+1)A(X) + B(X)] = 0.$$

Again contracting (5.8) over  $X$  and  $U$  we get

$$r[(n+1)A(Z) + (n-1)B(Z) + n(n-2)A(Z) + (n-2)A(Z)] = 0,$$

which implies

$$(5.12) \quad r[(n+1)A(Z) + B(Z)] = 0.$$

Replacing  $Z$  by  $X$  we get

$$(5.13) \quad r[(n+1)A(X) + B(X)] = 0.$$

Adding (5.9), (5.11) and (5.13) yields

$$r[(3n+6)A(X) + (n+2)B(X)] = 0,$$

which implies

$$r(n+2)[3A(X) + B(X)] = 0.$$

Therefore, either  $r = 0$  or  $3A(X) + B(X) = 0$ . Thus, we can state the following theorem:

**Theorem 5.1.** *If an Einstein (APMPS) $_n$ , ( $n > 2$ ) is an almost pseudo symmetric manifold, then the scalar curvature of the manifold vanishes provided  $3A(X) + B(X) \neq 0$ .*

Again, if in an (APMPS) $_n$   $r = 0$ , then using (1.6) and (5.6) in (5.4), we get

$$\begin{aligned} (\nabla_X R)(Y, Z, U, V) &= [A(X) + B(X)]R(Y, Z, U, V) \\ &+ A(Y)R(X, Z, U, V) + A(Z)R(Y, X, U, V) \\ &+ A(U)R(Y, Z, X, V) + A(V)R(Y, Z, U, X). \end{aligned}$$

Hence we have the following theorem:

**Theorem 5.2.** *If in an Einstein (APMPS) $_n$ , ( $n > 2$ ) the scalar curvature vanishes, then it is an almost pseudo symmetric manifold.*

Now, Let  $\rho$  be a vector field defined by

$$g(X, \rho) = \alpha(X),$$

where  $\alpha(X) = A(X) - B(X)$ .

Further, we suppose that in an Einstein (APMPS) $_n$ , the vector field  $\rho$  defined above is parallel. Then we have

$$(5.14) \quad \nabla_X \rho = 0$$

for all  $X$ . By Ricci identity and (5.4) we get

$$(5.15) \quad R(X, Y, \rho, U) = 0,$$

which implies

$$(5.16) \quad S(Y, \rho) = 0.$$

Using (5.1) in (5.16) we get

$$rg(Y, \rho) = 0.$$

Thus, either  $r = 0$  or  $\|\rho\|^2 \neq 0$ . If  $r = 0$  then using (1.6) and (5.6) in (5.4), it follows that the manifold is an almost pseudo symmetric manifold. Thus we have:

**Theorem 5.3.** *If the vector field defined by  $g(X, \rho) = A(X) - B(X)$  is a parallel vector field in an Einstein  $(APMPS)_n$ , ( $n > 2$ ), then it is an almost pseudo symmetric manifold provided  $\|\rho\| \neq 0$ .*

## 6. Examples of $(APMPS)_n$

### Example1

Let us consider a Lorentzian metric  $g$  on  $\mathbb{R}^4$  defined by

$$(6.1) \quad ds^2 = g_{ij}dx^i dx^j = x^1(dx^1)^2 + x^1(dx^2)^2 + x^1(dx^3)^2 - (dx^4)^2$$

where  $i, j = 1, 2, 3, 4$ . Then the only non-vanishing components of the Christoffel symbols, the Riemannian curvature tensors and the Ricci tensor are

$$\Gamma_{22}^1 = \Gamma_{33}^1 = -\frac{1}{2x^1}, \quad \Gamma_{11}^1 = \Gamma_{12}^2 = \Gamma_{13}^3 = \frac{1}{2x^1},$$

$$R_{1221} = R_{1331} = -\frac{1}{2x^1}, \quad R_{2332} = \frac{1}{4x^1},$$

and

$$S_{22} = S_{33} = -\frac{1}{4(x^1)^2}, \quad S_{11} = -\frac{1}{(x^1)^2}, \quad S_{44} = 0.$$

And the scalar curvature of the resulting manifold  $(\mathbb{R}^4, g)$  is

$$r = -\frac{3}{2(x^1)^3}.$$

Now, the non vanishing components of  $m$ -projective curvature tensor and their covariant derivatives are:

$$M_{1221} = M_{1331} = -\frac{7}{24x^1}, \quad M_{2332} = \frac{1}{3x^1},$$

$$M_{1221,1} = M_{2332,1} = \frac{7}{24x^2}, \quad M_{2332,1} = -\frac{1}{3x^2},$$

where ‘,’ denotes the covariant derivative with respect to the metric tensor.

Let us choose the associated 1-forms as follows:

$$A_i(x) = \begin{cases} 0, & \text{for } i = 1 \\ x^1, & \text{otherwise,} \end{cases} \quad (6.2)$$

$$B_i(x) = \begin{cases} -\frac{1}{x^1}, & \text{for } i = 1 \\ -x^1, & \text{otherwise,} \end{cases} \quad (6.3)$$

at any point  $x \in \mathbb{R}^4$ . To verify the relation (1.6), it is sufficient to check the following equations:

$$M_{1221,1} = [A_1 + B_1]M_{1221} + A_1M_{1221} + A_2M_{1121} + A_2M_{1211} + A_1M_{1221}, \quad (6.4)$$

and

$$M_{2332,1} = [A_1 + B_1]M_{2332} + A_2M_{1332} + A_3M_{2132} + A_3M_{2312} + A_2M_{2331}. \quad (6.5)$$

Since for the other cases (1.5) holds trivially. By (6.2) and (6.3) we get

$$\begin{aligned} R.H.S. \text{ of } (6.4) &= [A_1 + B_1]M_{1221} + A_1M_{1221} + A_1M_{1221} \\ &= [3A_1 + B_1]M_{1221} \\ &= 3(0)\left(-\frac{7}{24x^1}\right) + \left(-\frac{1}{x^1}\right)\left(-\frac{7}{24x^1}\right) \\ &= \frac{7}{24x^2} \\ &= M_{1212,1} \\ &= L.H.S. \text{ of } (6.4). \end{aligned}$$

By a similar argument it can be shown that (6.5) is also true. So  $(\mathbb{R}^4, g)$  is a  $(APMPS)_n$ .

### Example2

Consider a Riemannian space  $V_n$ , ( $n \geq 4$ ) with the metric is given by

$$ds^2 = \phi(dx^1)^2 + K_{\alpha\beta}dx^\alpha dx^\beta + 2dx^1 dx^n, \quad (6.6)$$

where  $[K_{\alpha\beta}]$  is a symmetric and non singular matrix consisting of constants and  $\phi$  is a function of  $x^1, x^2, \dots, x^{n-1}$  and independent of  $x^n$ , and  $1 < \alpha, \beta < n$ .

In the metric considered, the only non-vanishing components of Christoffel symbols, Riemannian curvature tensor and Ricci tensor are [19]

$$\Gamma_{11}^{\beta} = -\frac{1}{2}K^{\alpha\beta}\phi_{,\alpha}, \quad \Gamma_{11}^n = \frac{1}{2}\phi_{,1}, \quad , \Gamma_{1\alpha}^n = \frac{1}{2}\phi_{,\alpha},$$

$$(6.7) \quad R_{1\alpha\beta 1} = \frac{1}{2}\phi_{,\alpha\beta}, \quad S_{11} = \frac{1}{2}K^{\alpha\beta}\phi_{,\alpha\beta},$$

where ‘.’ denotes the partial differentiation with respect to the coordinates and  $K^{\alpha\beta}$  are the elements of the matrix inverse to  $[K_{\alpha\beta}]$ . Here we consider  $K_{\alpha\beta}$  as Kronecker symbol  $\delta_{\alpha\beta}$  and

$$\phi = (M_{\alpha\beta} + \delta_{\alpha\beta})x^{\alpha}x^{\beta}e^{(x^1)^2},$$

where  $M_{\alpha\beta}$  are constant and satisfy the relations

$$\begin{aligned} M_{\alpha\beta} &= 0, \text{ for } \alpha \neq \beta, \\ &\neq 0, \text{ for } \alpha = \beta, \\ \sum_{\alpha=1}^{n-1} M_{\alpha\alpha} &= 0. \end{aligned}$$

This is to be noted that the metric with this form of  $\phi$  was considered by De and Gazi [12]. Thus we have

$$\begin{aligned} \phi_{\alpha\beta} &= 2(M_{\alpha\beta} + \delta_{\alpha\beta})e^{(x^1)^2}, \quad \delta_{\alpha\beta}\delta^{\alpha\beta} = n - 2, \\ \delta^{\alpha\beta}M_{\alpha\beta} &= \sum_{\alpha=1}^{n-1} M_{\alpha\alpha} = 0. \end{aligned}$$

Therefore

$$\delta^{\alpha\beta}\phi_{\alpha\beta} = 2(\delta^{\alpha\beta}M_{\alpha\beta} + \delta^{\alpha\beta}\delta_{\alpha\beta})e^{(x^1)^2} = 2(n - 2)e^{(x^1)^2}.$$

Since  $\phi_{\alpha\beta}$  vanishes for  $\alpha \neq \beta$ , the only non-zero components of the Riemannian curvature tensor and Ricci tensor by virtue of (6.7) are

$$R_{1\alpha\alpha 1} = \frac{1}{2}\phi_{,\alpha\alpha} = (1 + M_{\alpha\alpha})e^{(x^1)^2},$$

$$S_{11} = \frac{1}{2}\phi_{,\alpha\beta}\delta^{\alpha\beta} = (n - 2)e^{(x^1)^2}.$$

Also, the scalar curvature  $r = 0$ .

Hence the only non-zero components of the  $m$ -projective curvature tensor, and their covariant derivatives are

$$\begin{aligned} M_{1\alpha\alpha 1} &= (1 + M_{\alpha\alpha})e^{(x^1)^2} + \frac{n - 2}{2(n - 1)}e^{(x^1)^2} \\ &= \left(1 + \frac{n}{2(n - 1)}M_{\alpha\alpha}\right)e^{(x^1)^2}, \end{aligned}$$

$$\begin{aligned} M_{1\alpha\alpha 1,1} &= 2x^1 \left(1 + \frac{n}{2(n-1)} M_{\alpha\alpha}\right) e^{(x^1)^2} \\ &= 2x^1 M_{1\alpha\alpha 1}, \end{aligned}$$

where ‘,’ denotes the covariant derivative with respect to the metric tensor.

Let us choose the associated 1-forms as follows:

$$A_i(x) = \begin{cases} x^1, & \text{for } i = 1 \\ 0, & \text{otherwise,} \end{cases} \quad (6.8)$$

$$B_i(x) = \begin{cases} -x^1, & \text{for } i = 1 \\ 0, & \text{otherwise,} \end{cases}$$

at any point  $x \in V_n$ . To verify the relation (1.6), it is sufficient to check the following equation:

$$(6.9) \quad M_{1\alpha\alpha 1,1} = (3A_1 + B_1)M_{\alpha 11\alpha}$$

$$\begin{aligned} R.H.S. \text{ of } (6.9) &= (3A_1 + B_1)M_{1\alpha\alpha 1} \\ &= (3x^1 - x^1)M_{1\alpha\alpha 1} \\ &= 2x^1 M_{1\alpha\alpha 1} \\ &= M_{1\alpha\alpha 1,1} \\ &= L.H.S. \text{ of } (6.9). \end{aligned}$$

So  $V_n$  is a  $(APMPS)_n$ .
