SOME CLASSES OF INTEGRAL GRAPHS WHICH BELONG TO THE CLASS $\overline{\alpha K_a \cup \beta K_{b,b}}$

Mirko Lepović

Communicated by Slobodan Simić

Abstract. Let G be a simple graph and let $\overline{G}$ denote its complement. We say that G is integral if its spectrum consists of integral values. We have recently established a characterization of integral graphs which belong to the class $\overline{\alpha K_a \cup \beta K_{b,b}}$, where mG denotes the m-fold union of the graph G. In this work we investigate integral graphs from the class $\overline{\alpha K_a \cup \beta K_{b,b}}$ with $\overline{\lambda}_1 = a+b$, where $\overline{\lambda}_1$ is the largest eigenvalue of $\overline{\alpha K_a \cup \beta K_{b,b}}$.

In this work we consider only simple graphs. The spectrum of a simple graph G of order n contains the eigenvalues $\lambda_1 \geqslant \lambda_2 \geqslant \cdots \geqslant \lambda_n$ of the ordinary adjacency matrix of G, and is denoted by $\sigma(G)$. A graph G is called integral if its spectrum $\sigma(G)$ consists only of integers [**1**].

An eigenvalue μ of G is main if and only if $\langle \mathbf{j}, \mathbf{Pj} \rangle = n\cos^2\alpha > 0$, where $\mathbf{j}$ is the main vector (with coordinates equal to 1) and $\mathbf{P}$ is the orthogonal projection of the space $\mathbb{R}^n$ onto the eigenspace $\mathcal{E}_A(\mu)$. The quantity $\beta = |\cos\alpha|$ is called the main angle of μ.

Let K_n and $K_{m,n}$ denote the complete graph and the complete bipartite graph, respectively. We have recently described all integral graphs which belong to the classes $\overline{\alpha K_a \cup \beta K_b}$, $\overline{\alpha K_{a,b}}$, $\overline{K_{a,a} \cup K_{b,b}}$ and $\overline{\alpha K_a \cup \beta K_{b,b}}$ (see [**2**], [**3**], [**4**] and [**5**], respectively), where $\overline{G}$ and mG denote the complementary graph of G and the m-fold union of the graph G, respectively.

The characterization of integral graphs which is related to the class $\overline{\alpha K_a \cup \beta K_{b,b}}$ is reduced to the problem of finding the most general integral solution of the following Diophantine equation [**5**]

$$\big[(\alpha+1)a + (2\beta-1)b - 1\big]^2 - 4\alpha a(a-b-1) = \delta^2 \,. \tag{1}$$

In other words, $\overline{\alpha K_a \cup \beta K_{b,b}}$ is integral if and only if $(\alpha, \beta, a, b, \delta)$ represents a positive integral solution of the equation (1). We note that $\alpha K_a \cup \beta K_{b,b}$ is an

2000 *Mathematics Subject Classification*: Primary 05C50.
Key words and phrases: graph, eigenvalue, Diophantine equation, continued fractions.

integral graph with two main eigenvalues $\mu_a = a-1$ and $\mu_b = b$ for any $\alpha, \beta, a, b \in \mathbb{N}$ with $a \neq (b+1)$.

REMARK 1. We know that $\lambda_1 + \overline{\lambda}_1 \geqslant n-1$ for any graph G of order n with equality if and only if G is regular [**1**], where $\overline{\lambda}_1$ is the largest eigenvalue of $\overline{G}$. If $G = \alpha K_a \cup \beta K_{b,b}$ we obtain (i) $\overline{\lambda}_1 \geqslant 2b+1$ if $a > (b+1)$ and (ii) $\overline{\lambda}_1 \geqslant a+b$ if $a \leqslant b$.

In the sequel the symbol (m,n) denotes the greatest common divisor of integers m, n while $m \mid n$ means that m divides n.

THEOREM 1 (Lepović [**5**]). *If $\overline{\alpha K_a \cup \beta K_{b,b}}$ is integral then it belongs to one of the following classes of integral graphs:*

$$\overline{\Big[\pm \frac{2kt}{\tau}\, x_0 + \frac{4mt}{\tau}\, z\Big] K_a \cup \Big[\pm \frac{2kt}{\tau}\, y_0 + \frac{a}{\tau}\, z\Big](2n-1) K_{b,b}}\,, \tag{2}$$

where (i) $a = \pm\big[2t + (2\ell-1)(2n-1)\big]k + (2\ell-1)m + 1$ and $b = (2\ell-1)m$; (ii) $t, k, \ell, m, n \in \mathbb{N}$ such that $(m, 2n-1) = 1$, $(2n-1, 2t) = 1$ and $(2\ell-1, 2t) = 1$; (iii) $\tau = (a, 4mt)$ such that $\tau \mid 2kt$; (iv) x_0 and y_0 is a particular solution of the linear Diophantine equation $ax - (4mt)y = \tau$ and (v) $z \geqslant z_0$, where $z_0 = \min \mathbb{Z}$ such that $(\pm \frac{2kt}{\tau}\, x_0 + \frac{4mt}{\tau}\, z_0) \geqslant 1$ and $\big(\pm \frac{2kt}{\tau}\, y_0 + \frac{a}{\tau}\, z_0\big) \geqslant 1$;

$$\overline{\Big[\pm \frac{(2t-1)k}{\tau}\, x_0 + \frac{2m(2t-1)}{\tau}\, z\Big] K_a \cup \Big[\pm \frac{(2t-1)k}{\tau}\, y_0 + \frac{a}{\tau}\, z\Big](2n-1) K_{b,b}}\,, \tag{3}$$

where (i) $a = \pm\big[(2t-1) + (2\ell-1)(2n-1)\big]k + (2\ell-1)m + 1$ and $b = (2\ell-1)m$; (ii) $t, k, \ell, m, n \in \mathbb{N}$ such that $(m, 2n-1) = 1$, $(2n-1, 2t-1) = 1$ and $(2\ell-1, 2t-1) = 1$; (iii) $\tau = (a, 2m(2t-1))$ such that $\tau \mid (2t-1)k$; (iv) x_0 and y_0 is a particular solution of the linear Diophantine equation $ax - 2m(2t-1)y = \tau$ and (v) $z \geqslant z_0$ where $z_0 = \min \mathbb{Z}$ such that $(\pm \frac{(2t-1)k}{\tau}\, x_0 + \frac{2m(2t-1)}{\tau}\, z_0) \geqslant 1$ and $\big(\pm \frac{(2t-1)k}{\tau}\, y_0 + \frac{a}{\tau}\, z_0\big) \geqslant 1$;

$$\overline{\Big[\pm \frac{(2t-1)k}{\tau}\, x_0 + \frac{(2t-1)m}{\tau}\, z\Big] K_a \cup \Big[\pm \frac{(2t-1)k}{\tau}\, y_0 + \frac{a}{\tau}\, z\Big] n K_{b,b}}\,, \tag{4}$$

where (i) $a = \pm\big[(2t-1) + 2\ell n\big]k + \ell m + 1$ and $b = \ell m$; (ii) $t, k, \ell, m, n \in \mathbb{N}$ such that $(m,n) = 1$, $(n, 2t-1) = 1$ and $(\ell, 2t-1) = 1$; (iii) $\tau = (a, (2t-1)m)$ such that $\tau \mid (2t-1)k$; (iv) x_0 and y_0 is a particular solution of the linear Diophantine equation $ax - (2t-1)my = \tau$ and (v) $z \geqslant z_0$ where $z_0 = \min \mathbb{Z}$ with $(\pm \frac{(2t-1)k}{\tau}\, x_0 + \frac{(2t-1)m}{\tau}\, z_0) \geqslant 1$ and $\big(\pm \frac{(2t-1)k}{\tau}\, y_0 + \frac{a}{\tau}\, z_0\big) \geqslant 1$. In these classes the symbol '$\pm$' is related to '$+$' if $a > (b+1)$; and '$\pm$' is related to '$-$' if $a \leqslant b$.

If $\overline{\alpha K_a \cup \beta K_{b,b}}$ is an integral graph then it uniquely determines the parameters t, τ, k, ℓ, m, n. However, if x_0 and y_0 is obtained by using the EUCLID algorithm then a fixed integral graph $\overline{\alpha K_a \cup \beta K_{b,b}}$ also uniquely determines the parameters x_0, y_0, z_0, z (see [**5**]).

Using Theorem1 we proved in [**5**] the following results: (i) if $\overline{\alpha K_a \cup \beta K_{b,b}}$ is integral with $\overline{\lambda}_1 = 2b+1$ and $a > (b+1)$ then it is $\overline{K_5 \cup K_{2,2}}$; (ii) if $\overline{\alpha K_a \cup \beta K_{b,b}}$

is integral with $\overline{\lambda}_1 = 2b+1$ and $a \leqslant b$ then it belongs to the class of integral graphs $\overline{3K_t \cup K_{4t-2,4t-2}}$, where $t \in \mathbb{N}$ and (iii) if $\overline{\alpha K_a \cup \beta K_{b,b}}$ is integral with $\overline{\lambda}_1 = a+b$ and $a \leqslant b$ then it is one of the following two integral graphs $\overline{K_2 \cup K_{6,6}}$ or $\overline{K_3 \cup K_{6,6}}$.

The characterization of integral graphs with $\overline{\lambda}_1 = a+b$ and $\lambda_1 = a-1$ is reduced to the problem of finding the most general positive solution of the equation $x^2 - dy^2 = c$, where d is not a perfect square. It is based on the concept of continued fractions and some basic results which are related to $x^2 - dy^2 = c$ (see [**6**]).

Let $a_0, a_1, \dots, a_n$ be a sequence of integers with $a_i > 0$ for $i \geqslant 1$. Then the term $[a_0; a_1, \dots, a_n] = [a_0; a_1, \dots, a_{n-1} + \frac{1}{a_n}]$ is called the simple continued fraction, where $[a_0; a_1] = a_0 + \frac{1}{a_1}$. If $a_0, a_1, a_2, \dots$ is an infinite sequence of integers with $a_i > 0$ for $i \geqslant 1$, the expression $[a_0; a_1, a_2, \dots] = \lim_{n \to +\infty} [a_0; a_1, \dots, a_n]$ is called the infinite simple continued fraction. We say that $[a_0; a_1, \dots, a_{m-1}, \overline{a_m, \dots, a_{m+r-1}}]$ is an infinite simple continued fraction of periodic r if r is the least positive integer such that $a_{r+n} = a_n$ for any $n \geqslant m$.

Let $a_0, a_1, \dots$ be a sequence of integers with $a_i > 0$ for $i \geqslant 1$. We then define two associated sequences $\{p_n\}$ and $\{q_n\}$ by $p_i = a_i p_{i-1} + p_{i-2}$ and $q_i = a_i q_{i-1} + q_{i-2}$ for $i \geqslant 0$, where $p_{-2} = 0$, $p_{-1} = 1$ and $q_{-2} = 1$, $q_{-1} = 0$. The rational number $\frac{p_n}{q_n} = [a_0; a_1, \dots, a_n]$ is called the n-th convergent to the infinite simple continued fraction.

Next, the general solution of the Pell equation $x^2 - dy^2 = 1$ is given in the form $x_i + y_i\sqrt{d} = (x_1 + y_1\sqrt{d})^i$, where $x_1 + y_1\sqrt{d}$ is its fundamental solution. We know that $x_1 + y_1\sqrt{d} = p_{r-1} + q_{r-1}\sqrt{d}$ if r is even, and $x_1 + y_1\sqrt{d} = p_{2r-1} + q_{2r-1}\sqrt{d}$ if r is odd, where r is the period length of $\sqrt{d}$. If $\rho_0 + \varphi_0\sqrt{d}$ is a fundamental solution of the equation $x^2 - dy^2 = c$, then

$$\rho_i + \varphi_i\sqrt{d} = (\rho_0 + \varphi_0\sqrt{d})(x_1 + y_1\sqrt{d})^i$$

represents a class of solutions of $x^2 - dy^2 = c$. Using the last relation we easily find that $\rho_i = \rho_0 x_i + d\varphi_0 y_i$ and $\varphi_i = \varphi_0 x_i + \rho_0 y_i$ for any $i \geqslant 0$, understanding that $x_0 = 1$ and $y_0 = 0$. Besides, we have

$$\rho_i = \frac{\rho_0 + \varphi_0\sqrt{d}}{2}\left(x_1 + y_1\sqrt{d}\right)^i + \frac{\rho_0 - \varphi_0\sqrt{d}}{2}\left(x_1 - y_1\sqrt{d}\right)^i; \tag{5}$$

$$\varphi_i = \frac{\rho_0 + \varphi_0\sqrt{d}}{2\sqrt{d}}\left(x_1 + y_1\sqrt{d}\right)^i - \frac{\rho_0 - \varphi_0\sqrt{d}}{2\sqrt{d}}\left(x_1 - y_1\sqrt{d}\right)^i. \tag{6}$$

Finally, for any fundamental solution $\rho_0 + \varphi_0\sqrt{d}$ of the equation $x^2 - dy^2 = c$, the following two relations are satisfied [**6**]

$$0 \leqslant |\rho_0| \leqslant \sqrt{\frac{c(x_1+1)}{2}} \quad \text{and} \quad 0 \leqslant \varphi_0 \leqslant y_1\sqrt{\frac{c}{2(x_1+1)}}. \tag{7}$$

Using the concept of continued fractions we proved in [**5**] that there is no integral graph from the class $\overline{\alpha K_a \cup (3\beta+2)K_{b,b}}$ with $\overline{\lambda}_1 = a+b$ and $a > (b+1)$ for any $\beta \in \mathbb{N}$. It is also observed that there is no integral graph from the class $\overline{\alpha K_a \cup \beta K_{b,b}}$ with $\overline{\lambda}_1 = a+b$ and $a > (b+1)$ for $\beta = 1$.

The characterization of integral graphs with $\overline{\lambda}_1 = a + b$ and $\lambda_1 = a - 1$ is reduced to the problem of finding the most general positive integral solution of the following two Diophantine equations:

$$\big[8\eta(\eta\dot{n} - 1)m - k\big]^2 - \big[16\eta\dot{n}(\eta\dot{n} - 1) + 1\big]k^2 = 16\eta(\eta\dot{n} - 1)\,, \tag{8}$$

where $\dot{n} = 2n - 1$ and $\beta = \eta\dot{n}$; (1.1) $a = (2\ell - 1)(2t - 1)$; (1.2) $b = (2\ell - 1)m$; (1.3) $(2\ell - 1) = 2\eta m + k$ and (1.4) $(2t - 1) = (2\ell - 1)\dot{n} - m$; and

$$\big[4\eta(\eta n - 1)m - k\big]^2 - \big[16\eta n(\eta n - 1) + 1\big]k^2 = 8\eta(\eta n - 1)\,, \tag{9}$$

where $\beta = \eta n$ and (2.1) $a = (2t - 1)\ell$; (2.2) $b = \ell m$; (2.3) $\ell = \eta m + k$ and (2.4) $(2t - 1) = 2\ell n - m$ (see [**5**]).

Further, let $x = 8\eta(\eta\dot{n} - 1)m - k$ and let $y = k$. Let $d = 16\eta\dot{n}(\eta\dot{n} - 1) + 1$ and let $\rho_0 + \varphi_0\sqrt{d}$ be a fundamental solution of $x^2 - dy^2 = 16\eta(\eta\dot{n} - 1)$. Then $k = \varphi_i$ and $m = \frac{\rho_i + \varphi_i}{8\eta(\eta\dot{n} - 1)}$, understanding that $\rho_i + \varphi_i\sqrt{d}$ is the i-th solution which belongs to the class with respect to $\rho_0 + \varphi_0\sqrt{d}$. It was proved in [**5**] that $8\eta(\eta\dot{n} - 1) \mid (\rho_i + \varphi_i)$ if and only if $8\eta(\eta\dot{n} - 1) \mid (\rho_0 + \varphi_0)$. Consequently, the most general integral solution of (8) is reduced to the positive fundamental solutions $\rho_0 + \varphi_0\sqrt{d}$ for which $8\eta(\eta\dot{n} - 1) \mid (\rho_0 + \varphi_0)$. Similarly, the most general integral solution of (9) is reduced to the positive fundamental solutions $\rho_0 + \varphi_0\sqrt{d}$ for which $4\eta(\eta n - 1) \mid (\rho_0 + \varphi_0)$.

We now proceed to establish a characterization of integral graphs $\overline{\alpha K_a \cup \beta K_{b,b}}$ with $\overline{\lambda}_1 = a + b$ and $a > (b + 1)$ for $\beta = 2, 3, 4$. We note first if $\overline{\alpha K_a \cup \beta K_{b,b}}$ is an integral graph with $\overline{\lambda}_1 = a + b$ and $\lambda_1 = a - 1$ then $(a + b) + (a - 1) \geqslant \alpha a + 2\beta b$ (see Remark1), which implies that $\alpha = 1$.

Proposition 1. *If $\overline{\alpha K_a \cup 2K_{b,b}}$ is integral with $\overline{\lambda}_1 = a + b$ and $a > (b + 1)$ then it belongs to the following class of integral graphs*

$$\overline{K_{a_+ z_+^{2i} + a_- z_-^{2i} + \frac{1}{33}} \cup 2K_{b_+ z_+^{2i} + b_- z_-^{2i} + \frac{7}{33},\, b_+ z_+^{2i} + b_- z_-^{2i} + \frac{7}{33}}}$$

where $z_\pm = 23 \pm 4\sqrt{33}$ and $i \geqslant 0$, $a_\pm = \frac{247 \pm 43\sqrt{33}}{33}$ and $b_\pm = \frac{46 \pm 8\sqrt{33}}{33}$.

Proof. We shall first consider the general positive integral solution of the equation (8) for $\eta\dot{n} = 2$. Clearly, $\dot{n} = 1$ and $\eta = 2$. Then relation (8) is reduced to $x^2 - 33y^2 = 32$. Using a computer program[1] we obtain that $\sqrt{33} = [5; \overline{1, 2, 1, 10}\,]$ and $23 + 4\sqrt{33}$ is the fundamental solution of the equation $x^2 - 33y^2 = 1$. Since $\rho_0 \leqslant 19$ and $\varphi_0 \leqslant 3$ (see (7)), it is easy to verify that there is no fundamental solution of $x^2 - 33y^2 = 32$, which means that (8) does not generate any integral graph with $\beta = 2$.

Consider the general positive integral solution of the equation (9) for $\eta n = 2$. We shall distinguish the following two cases:

Case 1. ($n = 1$ and $\eta = 2$). Then (9) is reduced to (i) $x^2 - 33y^2 = 16$. We now find that $\rho_0 \leqslant 13$ and $\varphi_0 \leqslant 2$, and $4 + 0\sqrt{33}$ and $7 + \sqrt{33}$ are the fundamental

[1] All the results given in Propositions1,2 and3 are obtained by using the program called DIOPHANTUS, written by the author in the programming language C.

solutions of (i). Since $8 \nmid (4+0)$ it follows that the class of solutions of (i) which corresponds to $4+0\sqrt{33}$ does not generate any integral graph with $\beta = 2$. Since $m = \frac{\rho_i+\varphi_i}{8}$ and $k = \varphi_i$, for the fundamental solution $7+\sqrt{33}$, we obtain from (5) and (6) that

$$m = \frac{\sqrt{33}+5}{2\sqrt{33}}\left(23+4\sqrt{33}\right)^i + \frac{\sqrt{33}-5}{2\sqrt{33}}\left(23-4\sqrt{33}\right)^i;$$

$$k = \frac{7+\sqrt{33}}{2\sqrt{33}}\left(23+4\sqrt{33}\right)^i - \frac{7-\sqrt{33}}{2\sqrt{33}}\left(23-4\sqrt{33}\right)^i.$$

Further, making use of (2.1), (2.2), (2.3) and (2.4), from the previous relations we easily get

$$\ell = \frac{3\sqrt{33}+17}{2\sqrt{33}}\left(23+4\sqrt{33}\right)^i + \frac{3\sqrt{33}-17}{2\sqrt{33}}\left(23-4\sqrt{33}\right)^i;$$

$$\dot{t} = \frac{5\sqrt{33}+29}{2\sqrt{33}}\left(23+4\sqrt{33}\right)^i + \frac{5\sqrt{33}-29}{2\sqrt{33}}\left(23-4\sqrt{33}\right)^i,$$

which provides the class of integral graphs represented in Proposition 1, understanding that $\dot{p} = 2p-1$.

Case 2. ($n = 2$ and $\eta = 1$). Then (9) is reduced to (ii) $x^2 - 33y^2 = 8$. We now find that (iii) $\rho_0 \leqslant 9$ and $\varphi_0 \leqslant 1$. Using (iii) it is not difficult to show that there exists no fundamental solution of (ii), which completes the proof. □

Proposition 2. *If* $\overline{\alpha K_a \cup 3K_{b,b}}$ *is integral with* $\overline{\lambda}_1 = a+b$ *and* $a > (b+1)$ *then it belongs to one of the following three classes of integral graphs:*

$$\overline{K_{a_+ z_+^{2i} + a_- z_-^{2i} + \frac{1}{97}} \cup 3K_{b_+ z_+^{2i} + b_- z_-^{2i} + \frac{11}{97},\, b_+ z_+^{2i} + b_- z_-^{2i} + \frac{11}{97}}}$$

where $z_\pm = 62809633 \pm 6377352\sqrt{97}$ *and* $i \geqslant 0$*; and*

(1^0) $a_\pm = \frac{6170687737 \pm 626538413\sqrt{97}}{97}$ *and* $b_\pm = \frac{1309509107 \pm 132960505\sqrt{97}}{194}$;

(2^0) $a_\pm = \frac{5188723 \pm 526835\sqrt{97}}{194}$ *and* $b_\pm = \frac{550561 \pm 55901\sqrt{97}}{194}$ *and*

(3^0) $a_\pm = \frac{681412777 \pm 69186985\sqrt{97}}{194}$ *and* $b_\pm = \frac{72302819 \pm 7341239\sqrt{97}}{194}$.

Proof. We shall first consider the general positive integral solution of the equation (8) for $\eta\dot{n} = 3$.

Case 1.1 ($\dot{n} = 1$ and $\eta = 3$). Then (8) is reduced to (i) $x^2 - 97y^2 = 96$. We now have (ii) $\sqrt{97} = [9; \overline{1,5,1,1,1,1,1,1,5,1,18}]$; (iii) $62809633 + 6377352\sqrt{97}$ is the fundamental solution of the equation $x^2 - 97y^2 = 1$ and (iv) $\rho_0 \leqslant 54907$ and $\varphi_0 \leqslant 5575$. According to (iv) we find that $22+2\sqrt{97}$; $463+47\sqrt{97}$; $2738+278\sqrt{97}$ and $49589+5035\sqrt{97}$ are the fundamental solutions of (i). Since $48 \nmid (22+2)$; $48 \nmid (463+47)$ and $48 \nmid (2738+278)$, these solutions do not generate any integral graph with $\beta = 3$.

Consequently, the general solution of (i) is reduced to the class which corresponds to the fundamental solution $49589+5035\sqrt{97}$. Since $m=\frac{\rho_i+\varphi_i}{48}$ and $k=\varphi_i$, using (iii) and (5), (6), we obtain

$$m=\Big(\frac{1138\sqrt{97}+11208}{2\sqrt{97}}\Big)\,z_+^i\;+\;\Big(\frac{1138\sqrt{97}-11208}{2\sqrt{97}}\Big)\,z_-^i;$$
$$k=\Big(\frac{49589+5035\sqrt{97}}{2\sqrt{97}}\Big)\,z_+^i\;-\;\Big(\frac{49589-5035\sqrt{97}}{2\sqrt{97}}\Big)\,z_-^i.$$

Next, making use of (1.1), (1.2), (1.3) and (1.4), by a straight-forward calculation, we get from the last relation that

$$\dot\ell=\Big(\frac{11863\sqrt{97}+116837}{2\sqrt{97}}\Big)\,z_+^i\;+\;\Big(\frac{11863\sqrt{97}-116837}{2\sqrt{97}}\Big)\,z_-^i;$$
$$\dot t=\Big(\frac{10725\sqrt{97}+105629}{2\sqrt{97}}\Big)\,z_+^i\;+\;\Big(\frac{10725\sqrt{97}-105629}{2\sqrt{97}}\Big)\,z_-^i,$$

which provides the class of integral graphs represented in Proposition 2 (1^0).

Case 1.2 ($\dot n=3$ and $\eta=1$). Then (8) is reduced to (v) $x^2-97y^2=32$. According to (iii) and (7) we find that (vi) $\rho_0\leqslant 31701$ and $\varphi_0\leqslant 3218$. Using (vi) we get $138+14\sqrt{97}$ and $3063+311\sqrt{97}$ are the fundamental solutions of (v). Since $16\nmid(138+14)$ and $16\nmid(3063+311)$ it follows that (v) generates no integral graph with $\beta=3$.

Consider the general positive integral solution of the equation (9) for $\eta n=3$. We shall also distinguish the following two cases:

Case 2.1 ($n=1$ and $\eta=3$). Then (9) is reduced to (vii) $x^2-97y^2=48$. We now find that $\rho_0\leqslant 38825$ and $\varphi_0\leqslant 3942$; $40+4\sqrt{97}$, $719+73\sqrt{97}$ and $15965+1621\sqrt{97}$ are the fundamental solutions of (vii). Since $24\nmid(40+4)$ and $24\nmid(15965+1621)$ it remains to consider the fundamental solution $719+73\sqrt{97}$. Therefore, by an easy calculation we get $m=(\frac{33\sqrt{97}+325}{2\sqrt{97}})z_+^i+(\frac{33\sqrt{97}-325}{2\sqrt{97}})z_-^i$ and $k=(\frac{719+73\sqrt{97}}{2\sqrt{97}})z_+^i-(\frac{719-73\sqrt{97}}{2\sqrt{97}})z_-^i$, which yields $\ell=(\frac{86\sqrt{97}+847}{\sqrt{97}})z_+^i+(\frac{86\sqrt{97}-847}{\sqrt{97}})z_-^i$ and $\dot t=(\frac{311\sqrt{97}+3063}{2\sqrt{97}})z_+^i+(\frac{311\sqrt{97}-3063}{2\sqrt{97}})z_-^i$. So we get the class of integral graphs represented in Proposition 2 (2^0).

Case 2.2 ($n=3$ and $\eta=1$). Then (9) is reduced to (viii) $x^2-97y^2=16$. We now find that $\rho_0\leqslant 22416$ and $\varphi_0\leqslant 2275$; $4+0\sqrt{97}$ and $4757+483\sqrt{97}$ are the fundamental solutions of (viii). Consequently, since $8\nmid(4+0)$ and $8\mid(4757+483)$ we obtain that $m=(\frac{655\sqrt{97}+6451}{2\sqrt{97}})z_+^i+(\frac{655\sqrt{97}-6451}{2\sqrt{97}})z_-^i$; $k=(\frac{4757+483\sqrt{97}}{2\sqrt{97}})z_+^i-(\frac{4757-483\sqrt{97}}{2\sqrt{97}})z_-^i$; $\ell=(\frac{569\sqrt{97}+5604}{\sqrt{97}})z_+^i+(\frac{569\sqrt{97}-5604}{\sqrt{97}})z_-^i$; $\dot t=(\frac{6173\sqrt{97}+60797}{2\sqrt{97}})z_+^i+(\frac{6173\sqrt{97}-60797}{2\sqrt{97}})z_-^i$, which provides the class represented in Proposition 2 (3^0). $\square$

Proposition 3. *If* $\overline{\alpha K_a \cup 4K_{b,b}}$ *is integral with* $\overline{\lambda}_1 = a + b$ *and* $a > (b+1)$ *then it belongs to one of the following three classes of integral graphs:*

$$\overline{K_{a_+ z_+^{2i} + a_- z_-^{2i} + \frac{1}{193}} \cup 4K_{b_+ z_+^{2i} + b_- z_-^{2i} + \frac{15}{193},\, b_+ z_+^{2i} + b_- z_-^{2i} + \frac{15}{193}}}$$

where $z_\pm = 6224323426849 \pm 448036604040\sqrt{193}$ *and* $i \geqslant 0$*; and*

(1^0) $a_\pm = \frac{1209056824462393 \pm 87029814579823\sqrt{193}}{193}$ *and*

$b_\pm = \frac{179835915982455 \pm 12944872487449\sqrt{193}}{386}$;

(2^0) $a_\pm = \frac{758972 \pm 54632\sqrt{193}}{193}$ *and* $b_\pm = \frac{56445 \pm 4063\sqrt{193}}{193}$;

(3^0) $a_\pm = \frac{92695388006569 \pm 6672360030889\sqrt{193}}{386}$ *and* $b_\pm = \frac{6893786823015 \pm 496225633751\sqrt{193}}{386}$.

Proof. We shall first consider the general positive integral solution of the equation (8) for $\eta\dot{n} = 4$. Clearly, $\dot{n} = 1$ and $\eta = 4$. In this case (8) is reduced to (i) $x^2 - 193y^2 = 192$. We now have (ii) $\sqrt{193} = [13;\, \overline{1,8,3,2,1,3,3,1,2,3,8,1,26}\,]$; (iii) $6224323426849 + 448036604040\sqrt{193}$ is the fundamental solution of the Pell equation $x^2 - 193y^2 = 1$ and (iv) $\rho_0 \leqslant 24444530$ and $\varphi_0 \leqslant 1759555$. Using (iv) we find that $112+8\sqrt{193}$; $3362+242\sqrt{193}$; $87703+6313\sqrt{193}$; $871862+62758\sqrt{193}$ and $22743973 + 1637147\sqrt{193}$ are the fundamental solutions of (i). Since $96 \nmid (112+8)$; $96 \nmid (3362+242)$; $96 \nmid (87703+6313)$ and $96 \nmid (871862+62758)$, these solutions do not generate any integral graph with $\beta = 4$.

Thus, the general solution of (i) is reduced to the class which corresponds to the fundamental solution $22743973+1637147\sqrt{193}$. Making use of (iii) and (5), (6), we get implicitly that $m = (\frac{126985\sqrt{193}+1764132}{\sqrt{193}})z_+^i + (\frac{126985\sqrt{193}-1764132}{\sqrt{193}})z_-^i$ and $k = (\frac{22743973+1637147\sqrt{193}}{2\sqrt{193}})z_+^i - (\frac{22743973-1637147\sqrt{193}}{2\sqrt{193}})z_-^i$, which provides that $\dot{\ell} = (\frac{3668907\sqrt{193}+50970085}{2\sqrt{193}})z_+^i + (\frac{3668907\sqrt{193}-50970085}{2\sqrt{193}})z_-^i$; $\dot{t} = (\frac{3414937\sqrt{193}+47441821}{2\sqrt{193}})z_+^i + (\frac{3414937\sqrt{193}-47441821}{2\sqrt{193}})z_-^i$. So we arrive at the class of integral graphs represented in Proposition3 (1^0).

Consider the general positive integral solution of the equation (9) for $\eta n = 4$. We shall distinguish the following three cases:

Case 1. ($n = 1$ and $\eta = 4$). Then (9) is reduced to (v) $x^2 - 193y^2 = 96$. We now find that $\rho_0 \leqslant 17284892$ and $\varphi_0 \leqslant 1244193$; $17 + \sqrt{193}$, $403 + 29\sqrt{193}$, $12142 + 874\sqrt{193}$ and $3148778 + 226654\sqrt{193}$ are the fundamental solutions of (v). Of course, since $48 \nmid (17+1)$; $48 \nmid (12142+874)$ and $48 \nmid (3148778+226654)$, these solutions generate no integral graph with $\beta = 4$. For $403 + 29\sqrt{193}$ we have $m = (\frac{9\sqrt{193}+125}{2\sqrt{193}})z_+^i + (\frac{9\sqrt{193}-125}{2\sqrt{193}})z_-^i$; $k = (\frac{403+29\sqrt{193}}{2\sqrt{193}})z_+^i - (\frac{403-29\sqrt{193}}{2\sqrt{193}})z_-^i$; $\ell = (\frac{65\sqrt{193}+903}{2\sqrt{193}})z_+^i + (\frac{65\sqrt{193}-903}{2\sqrt{193}})z_-^i$ and $\dot{t} = (\frac{121\sqrt{193}+1681}{2\sqrt{193}})z_+^i + (\frac{121\sqrt{193}-1681}{2\sqrt{193}})z_-^i$, which provides the class of integral graphs represented in Proposition 3 (2^0).

Case 2. ($n = 2$ and $\eta = 2$). Then (9) is reduced to (vi) $x^2 - 193y^2 = 48$. We now find that $\rho_0 \leqslant 12222265$ and $\varphi_0 \leqslant 879777$; $56 + 4\sqrt{193}$, $1681 + 121\sqrt{193}$

and $435931+31379\sqrt{193}$ are the fundamental solutions of (vi). Consequently, since $24 \nmid (56+4)$, $24 \nmid (1681+121)$ and $24 \nmid (435931+31379)$, the equation (vi) does not generate any integral graph with $\beta = 4$.

Case 3. ($n = 4$ and $\eta = 1$). Then (9) is reduced to (vii) $x^2 - 193y^2 = 24$. We now find that $\rho_0 \leqslant 8642446$ and $\varphi_0 \leqslant 622096$; $6071 + 437\sqrt{193}$ and $1574389+113327\sqrt{193}$ are the fundamental solutions of (vii). Since $12 \nmid (6071+437)$ and $12 \mid (1574389 + 113327)$, we obtain for $1574389 + 113327\sqrt{193}$ that $m = (\frac{140643\sqrt{193}+1953875}{2\sqrt{193}})z_+^i + (\frac{140643\sqrt{193}-1953875}{2\sqrt{193}})z_-^i$ and $k = (\frac{1574389+113327\sqrt{193}}{2\sqrt{193}})z_+^i - (\frac{1574389-113327\sqrt{193}}{2\sqrt{193}})z_-^i$. In this way we obtain that $\ell = (\frac{126985\sqrt{193}+1764132}{\sqrt{193}})z_+^i + (\frac{126985\sqrt{193}-1764132}{\sqrt{193}})z_-^i$ and $\dot{t} = (\frac{1891117\sqrt{193}+26272237}{2\sqrt{193}})z_+^i + (\frac{1891117\sqrt{193}-26272237}{2\sqrt{193}})z_-^i$. Using these relations we obtain Proposition 3 (3^0). □

Table 1 contains the set of all integral graphs[2] from the class $\overline{\alpha K_a \cup \beta K_{b,b}}$, whose order '$o$' does not exceed 30. In this table an integral graph is described by the parameters α, β, a, b and ones presented in the class of integral graphs in Theorem 1. The symbol 'i' denotes the identification number of the corresponding integral graph. In Table 1 (i) graphs with identification numbers $1, 2, \ldots, 18$ belong to the classes represented by (2); (ii) graphs with identification numbers $19, 20, \ldots, 47$ belong to the classes represented by (3); and (iii) graphs with $i = 48, 49, \ldots, 70$ belong to the classes represented by (4). We note that there exist exactly 18, 29 and 23 non-isomorphic integral graphs from the classes described by (2), (3) and (4), respectively. In this table[3] identification number 20 is related to the integral graph with the largest eigenvalue $\overline{\mu}_1 = 2b+1$ and $a > (b+1)$, while identification numbers 4, 19 and 44 are related to the integral graphs with $\overline{\mu}_1 = 2b+1$ and $a \leqslant b$. In Table 1 there exists just one integral graph[4] with $\overline{\mu}_1 = (a+b)$ and $a > (b+1)$ and its identification number is 64 – the first next one has 12545 vertices. Identification numbers 24 and 50 are related to the integral graphs with $\overline{\mu}_1 = (a+b)$ and $a \leqslant b$.

There exist exactly 7556 non-isomorphic integral graphs which belong to the class $\overline{\alpha K_a \cup \beta K_{b,b}}$, whose order does not exceed 300. In particular, the total number of such integral graphs (obtained by using (2), (3) and (4)) is $(1433+888)$, $(1265+948)$ and $(1736+1286)$, respectively, where m and n in the expression $(m+n)$ are the numbers of integral graphs with $a > (b+1)$ and $a \leqslant b$, respectively. Table 2 contains a distribution of those graphs with respect to their orders. In Table 2 the number n in the symbol o^n denotes the number of integral graphs of the corresponding order $o = 1, 2, \ldots, 300$. In this table o^n is omitted if the corresponding number $n = 0$.

[2]The data given in Tables 1 and 2 are obtained in two different ways: (i) they are generated by using relations (2), (3) and (4); and (ii) by varying the parameters α, β, a, b in all possible ways in equation (1).

[3]In Tables 1 and 3 the number $\overline{\mu}_2$ denotes the second main eigenvalue of the corresponding integral graph $\overline{\alpha K_a \cup \beta K_{b,b}}$.

[4]For any integral graph $\overline{\alpha K_a \cup \beta K_{b,b}}$ with the largest eigenvalue $\overline{\mu}_1 = a+b$ we have (i) $\overline{\mu}_2 = -\frac{2\beta ab}{a+b}$ and (ii) $(a+b)(a+2b+1) = 2\beta b(2a+b)$ (see the proof of Theorem1).

Table 3

Table 3 contains the integral graphs $\overline{\alpha K_a \cup \beta K_{b,b}}$ with $\overline{\mu}_1 = a + b$ and $a > (b + 1)$, obtained from the classes represented in Propositions2 and3 for $i = 0$. We note that any graph in this list is an integral graph with the minimal number of vertices for the corresponding class. The first, second, …, sixth integral graph in List 3 belongs to the class described in Proposition m (n^0), where $(m, n) = (3, 2)$, (2,2), (2,3), (2,1), (3,3) and (3,1), respectively.

Acknowledgement. The author is very grateful to prof. Dragoš Cvetković for his valuable comments and suggestions concerning this paper.
